Contrast Enhanced Utrasound

Dr. Maryam Issa Al-Ani Lecturer – College of Medicine/ University of Baghdad

Objectives

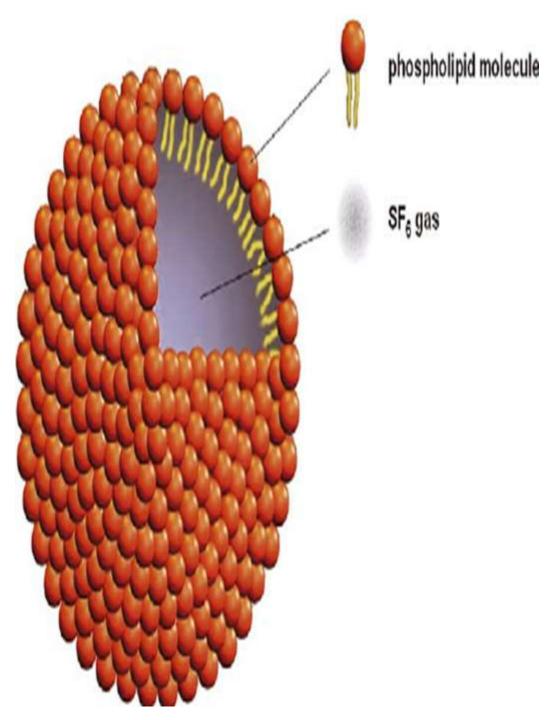

- \checkmark Composition of contrast ultrasound.
- ✓ Image Production.
- ✓ Advantages.
- \checkmark Side effect and contra indications.
- \checkmark Applications.
- ✓ Cases.

Ultrasound Contrast Agents

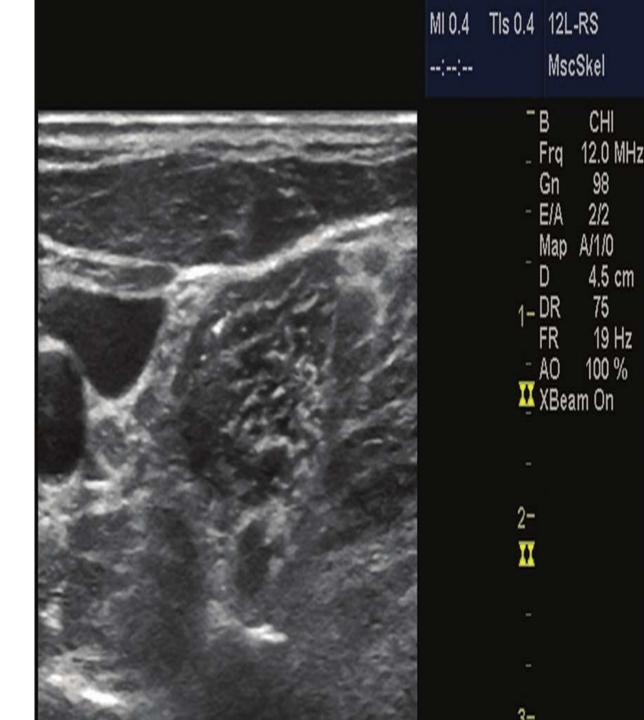

- UCA gas-filled microbubbles, stabilized within a lipoprotein shell.
- Smaller than red blood cells.
- Eliminated via the lungs within 20 min of administration.

Contrast Enhanced Image production

 Contrast specific software using <u>low</u> mechanical index (MI) is required to perform CEUS.

- The microbubbles have a <u>non-linear response</u>.
- When used with a low MI compared to other tissue types which have a linear response.
- Specific computer software with CEUS augments the non-linear response from the bubbles, creating a <u>vascular only image</u>

 This phenomenon makes the bloodstream more opaque compared to the tissues, producing images with greater contrast and thus yielding more diagnostic information

Advantages Over CE-CT & MRI

- The lack of radiation.
- UCA are <u>not</u> nephrotoxic nor hepatotoxic.
- Patients in <u>renal failure and even dialysis can safely</u> <u>undergo CEUS</u>.
- UCA have very few side effects and those that occur are extremely mild, including <u>headache</u> and <u>nausea</u>.
- UCA can be used in patients with iodine allergies.
- The only contraindication to the use of Lumason is sulfur hexafluoride allergy.
- Allergy to sulfa medication is <u>not</u> a contraindication.

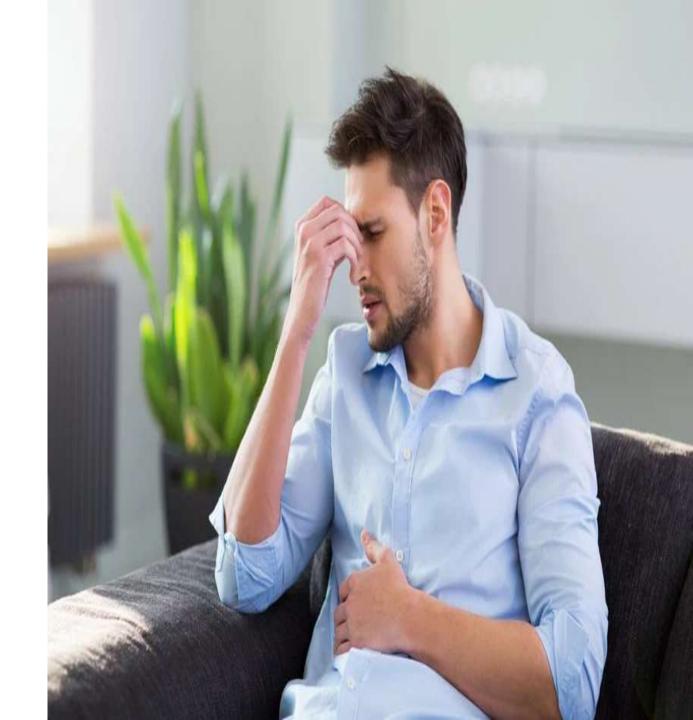

Side effects

Usually very mild like:

- back or flank pain.
- allergic reaction.

Other less common including :

- headache, dizziness
- flushing
- hypo or hypertension.

Contraindications

- known case or suspected cardiac shunts.
- allergic reaction to previous injection.
- intra arterial injection.

Applications of CEUS

Diagnostic :

- 1. Liver: focal liver lesion and diffuse liver disease.
- 2. Kidneys: solid renal masses , complex cysts and renal infarct.
- 3. Voiding cystourethrography.

4. targeted diagnosis.

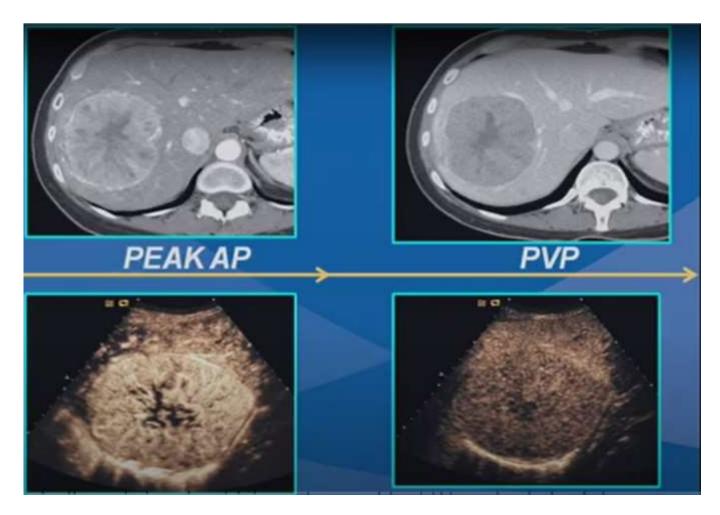

Applications of CEUS

Therapeutic:

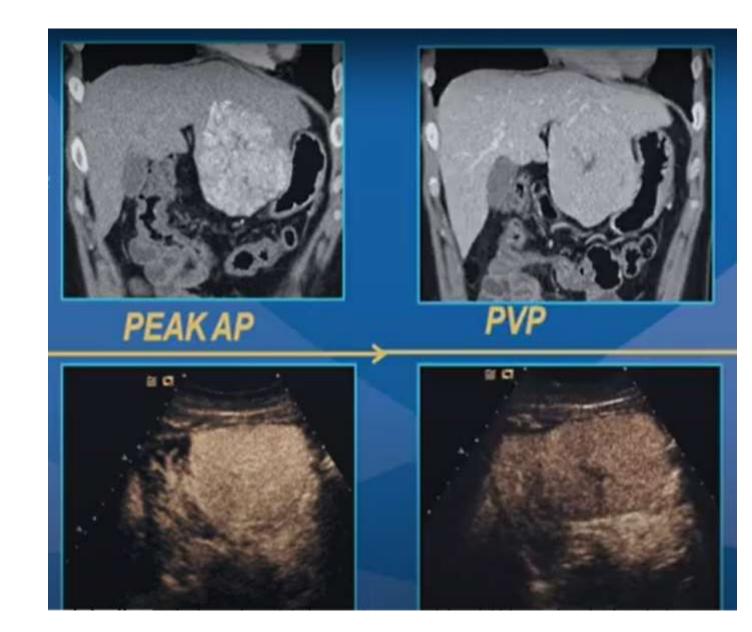

- 1. Thrombolytic effect.
- 2. Increasing Cell Membrane Permeability.
- 3. Increasing Blood-Brain Barrier Permeability.
- 4. Tissue Ablation

Image Interpretation

27 year old man with HBV

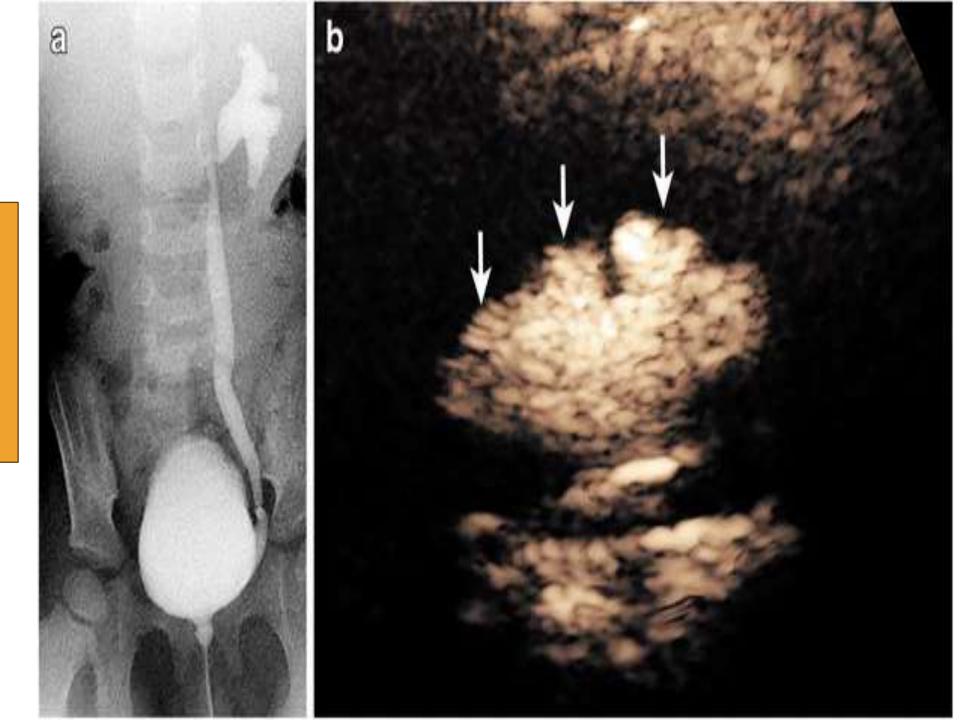

Young female asymptomatic

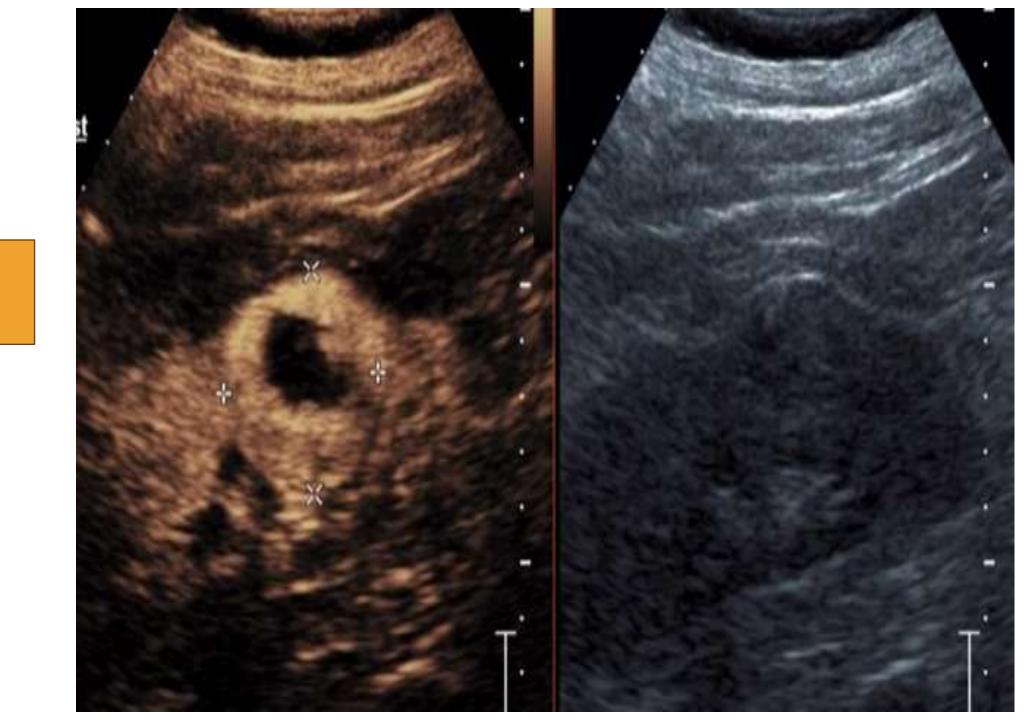

60 year old woman with history of breast cancer

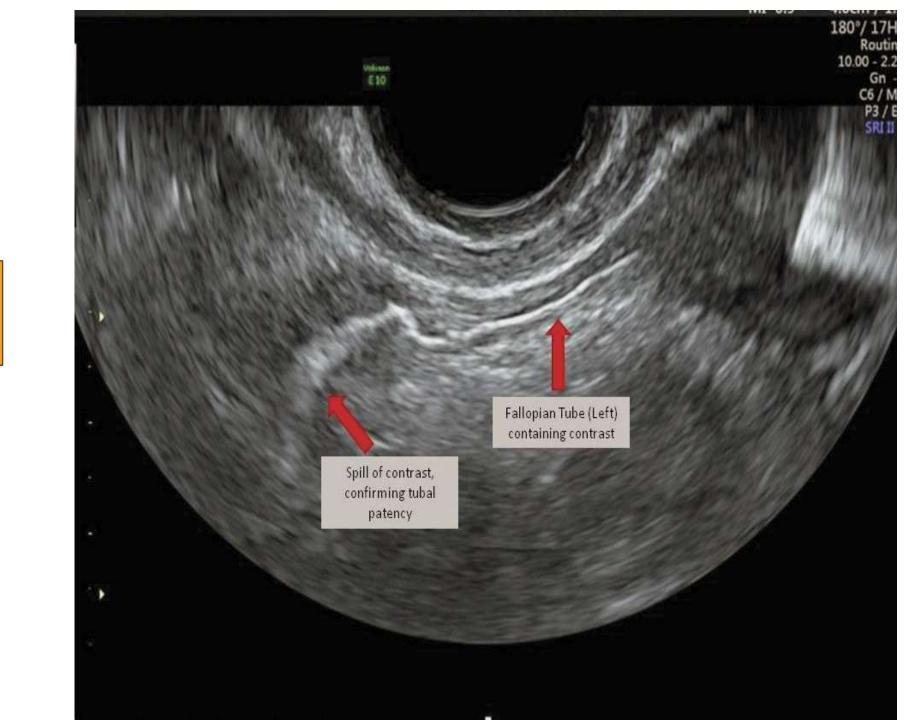

Small Bowel PRIMARY TUMOR CARCINOID

VUCG x-ray and US reveal left side VUR

RCC

To assess for tubal patency
